

# Checkpoint Web

created: 2022-03-21 22:17

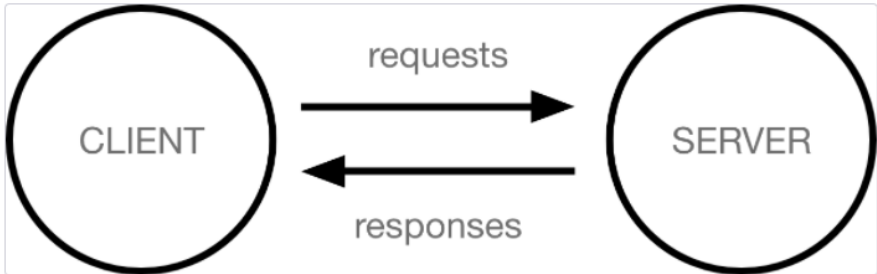

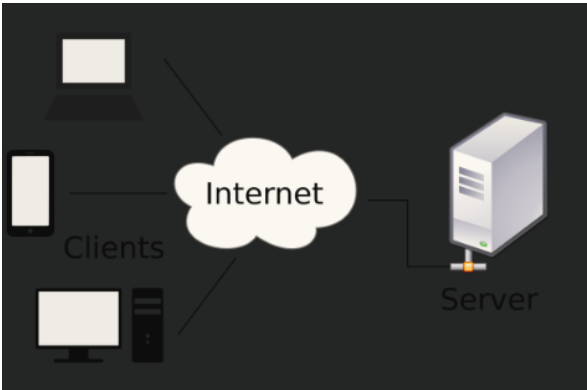

## Goal of the Projet :

- ★How does the web work?
- ★What do you need to be a web developer?
- ★What is the role of a web developer?

## How does the web work?

the Web can be summarized as a series of interactions between who types of systems, *Cientes* and *servsers*

- ★All the systems that are connected to the web are called clients ad servers in simple terms our client is a system which is going to send a *request* to the server and the server is a system which is going to process that request and send a reply back to the client in the form of a *response* that the client *browser* is going to translate into a web page or what the client requested.

## What do you need to be a web developer?

Well according to what i know if we talk about what you *Need* not the requirement to be a web dev you will need to learn some web fundamentals and then HTTP/CSS at least at base level so you can work with wordpress... effectively but for me i will be following this road map to complete the Front-end Web development (<https://roadmap.sh/frontend>)

## What is the role of a web developer?

A web developer can *create a website* from scratch or adjust and optimize an existing one.

Put differently, a web developer can do the most complicated parts of bringing your business online for you.

The end objective for a website creator should be a fully functional page where things are not overly simplified and not overly complicated. The looks also play an important factor, You also want everything to run smoothly or as some might say "not laggy".
